1 Introduction

1.1 Purpose

The purpose of this document is to provide the definition for the HL7 message interface for notifying diagnostic imaging report events to HIPS. Upon receiving these events, HIPS will upload or remove a corresponding Diagnostic Imaging Report document in the My Health Record system.

Please note that this version of the HL7 profile for HIPS has originated from the AS 4700.2-2012 - Australian Standard Implementation of Health Level Seven (HL7) Version 2.4, Part 2: Pathology and diagnostic imaging (diagnostics) specification and may contain more information than required in forming HL7 messages for loading into HIPS.

This document can be used by health facilities to understand the information passed in the HL7 messages and the portions relevant to HIPS. It describes the message and segment definitions that are required, expected, and processed by the HIPS application.

HIPS uses the standard message format described herein. The standard message format in use is HL7 2.4.

1.2 Scope

This profile covers all messages/message segments that have been standardised for diagnostic imaging reporting.

This profile does not describe any functional requirements, such as archiving or error reporting, as these are to be covered by other documentation.

1.3 Assumptions

The HL7 MLLP interface for sending Diagnostic Imaging Reports to the HIPS application has the following constraints:

- HL7 message segments will be sent in the order shown under “Message Definition” below
- HL7 message continuation standard will not be used and therefore each message sent/received must be complete
- Confidential information sent across the interface will be accepted “as is”
- HL7 Sequence Numbering is not used.

2 High Level HL7 – Diagnostic Imaging Usage

When uploading or removing diagnostic imaging reports via the interface described in this document, HIPS may be used in one of the following models.

- No HI Service connectivity (setting BypassHIService = true):
 - All IHIs are obtained by a separate application. Both MRN and IHI are included in all ORU messages. HIPS will trust the IHI has been validated by another system.
 - Where the HPI-I of the document author is contained within the HL7 message, HIPS will trust the HPI-I has been validated by another system.
 - Otherwise, where the facility has an exemption from the requirement to provide the HPI-I, HIPS will copy the local identifier of the author from the HL7 message into the diagnostic imaging report CDA document.
- With HI Service connectivity (setting ByPassHIService = false):
 - HIPS performs IHI search and validation, and checks for advertised My Health Record. The MRN and at least one of either an IHI, Medicare Card Number, or DVA File Number must be included in the HL7 messages to enable IHI lookup or validation.
 - Where the message contains the HPI-I of the document author, HIPS will validate the HPI-I before uploading the document.
 - Where the message contains a local identifier of the document author, HIPS will look up the HPI-I from the HIPS data store based on the local identifier, and validate the HPI-I if it has not been not validated within the configured period.
 - Otherwise, where the facility has an exemption from the requirement to provide the HPI-I, HIPS will copy the local identifier of the author from the HL7 message into the CDA document.

2.1 Patient Identifiers

When processing HL7 messages, HIPS will identify the Subject of Care (Patient) using a list of identifiers in the PID-3 field. This field may contain a primary local patient identifier and secondary patient identifiers (such as hospital MRNs) from various assigning authorities, in addition to a Medicare number, DVA file number, and/or IHI.

Each internal patient identifier or MRN must be supplied with CX-5 Type Code “PI” or “MR” and CX-4 Assigning Authority identifying the scope/origin of the identifier.

Example 1, an identifier from the diagnostic imaging provider with NATA number 2134:

```
123456^^^NATA2134^PI
```

Example 2, an identifier from the diagnostic imaging provider with LSPN 8234:

```
123456^^^LSPN8234^PI
```

Example 3, an MRN from a hospital (RNH):

123456^^^RNH^MR

Where “123456” is the MRN itself, “RNH” is a code for the hospital that allocated this MRN, and “MR” is a code that indicates that this is an MRN.

The assigning authority codes for the primary local patient identifiers for use in diagnostic imaging HL7 messages must be configured in the HIPS HospitalCode table and have a CodeSystemId of 114 which corresponds to a code system “patientIdAuthCd”.

The maximum local patient identifier length that HIPS can handle is 20 characters.

The Medicare number, if known, will be supplied with type code “MC” and may or may not include the Individual Reference Number (IRN). The value must be either 10 digits (without IRN) or 11 digits (with IRN). For example:

5123123123^^^AUSHIC^MC

51231231231^^^AUSHIC^MC

The DVA file number, if known, will be supplied with type code “DVA” (as in AS 4700.1-2001) or with separate type codes for gold “DVG”, orange “DVO” or white “DVW” (as in AS 4700.1-2005). For example:

Q 331321^^^DVA

VX141145A^^^AUSDVA^DVG

The IHI number may be supplied in the PID-3 field with type code “NI” and assigning authority “AUSHIC”. For example:

8003608833357361^^^AUSHIC^NI.

2.1.1 Zero Padding of local patient identifiers

Diagnostic imaging service providers operate various radiology information systems (RIS) that allocate patient identifiers of various lengths. Some RIS systems allocate identifiers of a variable length with no zeros on the left, while others automatically add zeros on the left to pad to a fixed length.

HIPS supports numeric and non-numeric local identifiers from 1 to 40 characters in length. The expected length for a local identifier is defined via the HIPS “Mrn.Padding” configuration setting, which specifies the total number of characters expected for a standardised local identifier. The default value for the configuration setting is 9, but can be configured to any value between 1 and 40.

To meet the requirements of this profile, any local patient identifier that is input via the HL7 interface will have zeros added to the beginning until it reaches the number of digits in length specified by the “Mrn.Padding” configuration setting. This applies equally to numeric and non-numeric identifiers.

If the identifier is already equal to or more than the number of characters in length specified by the “Mrn.Padding” configuration setting, then no further padding is added.

For example, with the default value of 9 for the “Mrn.Padding” configuration setting:

- “123456” (6 digits) will be padded with 3 zeros and stored as “000123456”
- “123456789” (9 digits) will not be padded
- “1234567890123456” (16 digits) will not be padded
- "ABCD" (4 letters) will be padded with 5 zeros and stored as "00000ABCD"

2.2 R01 – Send a Diagnostic Imaging Report

The ORU^R01 message structure is as follows:

Segment	Description
MSH	Message Header
PID	Patient Identification
[PV1]	Patient Visit
{	
ORC	Common Order
OBR	Observation Request
{OBX}	Observation Result

The following is an example of a fictitious HL7 message that might be used by “Sample Medical Imaging” (SMI) to send a Diagnostic Imaging Report from their RIS to HIPS for upload to the My Health Record system. The patient Harold Farmer is identified by a primary local ID 756764 assigned by SMI, and a secondary ID which is a hospital MRN 123456 assigned by RCH, and has Medicare card number 2951051141. The reporting radiologist and author Adrian Grignon is identified by an HPI-I 8003611566666859.

3 Low Level Protocol

3.1 Communications

HIPS communicates via SOAP web services or MLLP through Mirth Connect. The communication details are as follows:

Summary	
Connectivity:	SOAP 1.2 on HTTP 1.1 (optionally on TLS 1.0) MLLP via Mirth Connect
Connection Type:	Single Message (est. by sending system)
End of Segment:	Carriage Return
Character Set:	ASCII

3.2 Character Encoding/Standard

All messages should comply with the printable characters from the ASCII character set.

3.3 Message Framing

The message framing convention used will be SOAP Version 1.2. The web service description (WSDL) and XML schemas (XSD) are in the *Message framing WSDL and XML schemas* folder (included in the same zip file as this document).

The SOAP header will need WS-Addressing headers, Action and To, which are usually added by the SOAP client software.

The “User” parameter identifies the person who will be recorded in the HI Service and My Health Record system audit logs as responsible for the actions of the HIPS system upon receiving the message, including validating IHI and HPI-I identifiers, checking existence of a My Health Record, and uploading or removing the diagnostic imaging report.

The “xsi:type” attribute may specify the LocalUser or ResponsibleUser type.

The LocalUser type is used to supply the person’s name and ID at run time.

The ResponsibleUser type is used when the identity of the responsible person is pre-configured in the AuthorisedEmployeeName and AuthorisedEmployeeUserId columns of the Hospital table.

The MLLP interface in Mirth Connect is configured to use the ResponsibleUser type.

The “HL7Message” parameter contains the encoded HL7 message and may conveniently be represented with a CDATA tag. Each HL7 segment will end with a carriage return; the final segment in the message will end with a carriage return, followed by the end of CDATA tag.

The “Report” parameter may contain the base-64 encoded data representing the diagnostic imaging report PDF, if the report PDF was not supplied in an OBX segment of the HL7 message above.

The "ReportLocation" parameter contains the file name for the PDF, if the report PDF was not supplied by either method above.

Example:

```

4 Application Level Protocol

4.1 Message Definitions

Below is a list of the message segments that may be included in the HL7 message. Some of these segments have not been standardised. Consult the source system documentation to determine the segment detail.

Please note:

- Those segments with an “R/O” (Required/Optional) value of “R” are always sent.
- The segments which are optional in HL7 and will NOT be sent have been deleted from the listing.
- Any application that interfaces to this profile must support the receipt of any valid HL7 segment that can be sent in the HL7 message. Receiving and ignoring segments that are not applicable to the application is the expected approach.
- Grey segments are accepted but ignored by HIPS.

4.1.1 ORU – R01 Diagnostic Imaging Result Message

Segment	Name	R/O	Freq. of Occurrence
MSH	Message Header	R	1
EVN	Event	O	0 or 1
PID	Patient Identification	R	1
NK1	Next of Kin	O	Multiple
PV1	Patient Visit	R	1
PV2	Patient Visit – Additional	O	0 or 1
ORC	Common Order	R	0 or 1 for each OBR
OBR	Observation request	R	Multiple
OBX	Observation results	O	Multiple for each OBR

4.2 Segment Definition Notes

The format for the standardised message segments is defined in the tables below.

Please note:

- Shaded fields are not used by HIPS.
- Literal values for specific fields are enclosed in quotes (e.g. “2.4”).
- Those fields with an “R/O” value of “R” are always sent.

- Those fields with an “R/O” value “R*” or “O*” are a deviation from the HL7 2.4 standard with respect to optionality.
- Field lengths (for each repetition) are assumed to be as per HL7 2.4 standard unless otherwise noted in the ‘Format/Ref/Notes’ column.
- Please read section 5.4 regarding the use of the CE data type and non-standardised values prior to reading the segment definitions.

4.3 Common Segment Definitions

4.3.1 MSH – Message Header

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref/Notes
1	00001	Field Separator	R		ST	" "
2	00002	Encoding Characters	R		ST	"^~\&"
3	00003	Sending Application	R*		HD	Namespace ID^Universal ID^Universal ID Type HIPS stores the Namespace ID in HL7MessageLog.SendingApplication.
4	00004	Sending Facility	R*		HD	Namespace ID^Universal ID^Universal ID Type HIPS stores the Namespace ID in HL7MessageLog.SendingFacility. If the Universal ID component has a value, then Universal ID is the facility code. If the Universal ID component is blank, then Namespace ID is the facility code. The facility code determines which facility of which organisation is creating and uploading or removing the diagnostic imaging report. The facility code is also the assigning authority of the primary patient identifier. HIPS looks up the facility code in the Code column of the HospitalCode table where CodeSystemId is 114, which corresponds to a code system "patientIdAuthCd", the Assigning Authority that issues the primary internal identifier.
5	00005	Receiving Application	R*		HD	Not used
6	00006	Receiving Facility	R*		HD	Not used
7	00007	Message date/time stamp	O		TS	See section 5.2 – Date set to 14 characters HIPS stores this in HL7MessageLog.DateTimeOfMessage
8	00008	Security	O		ST	Not used

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref/Notes
9	00009	Message type	R		MSG	Message Type^Event Type^Message Structure "ORU^R01" for Diagnostic Imaging Results Message
10	00010	Message Control ID	R		ST	HIPS will store this in HL7MessageLog.MessageControlId.
11	00011	Processing ID	R		ID	Not used
12	00012	Version ID	R		VID	Not used
13	00013	Sequence Number	O		NM	Not used
14	00014	Continuation Pointer	O			Not used
15	00015	Accept Acknowledge Type	O		ID	Not used
16	00016	Application Acknowledge Type	O		ID	Not used
17	00017	Country Code	O		ID	Not used
18	00692	Character set	O		ID	Not used
19	00693	Principal language of message	O		CE	Not used
20	01317	Alternate Character Set Handling Scheme	O		ID	Not used

4.3.2 PID – Patient Identification Segment

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref/Notes
1	00104	Set ID – Patient ID	O		SI	Not used

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref/Notes

HIPS will validate this HPI-I if BypassHIService is false. HIPS will then map the result as the HPI-I of the document author and reporting radiologist.</p> <p>Otherwise, HIPS will look up the ID in the PasProviderIdentifier column of the HospitalHealthProviderIndividual table and look for an HPI-I assigned to that provider in the HPI-I column of the HealthProviderIndividualHpii table. If an HPI-I is found and not validated within the period configured in HpiiValidationPeriodDays, HIPS will validate this HPI-I. HIPS will then map the result as the HPI-I of the document author and reporting radiologist.</p> <p>If no HPI-I was found and the facility has an exemption from the requirement to provide the HPI-I of the document author and reporting radiologist, determined by the HospitalCode with CodeSystemId 115 "HpiiExemption" being set to "true", HIPS will look up the Assigning Authority Namespace ID in the Code column of the CodeSystem table where HL7FieldPosition is "OBR-32.1.9" to determine the OID for mapping the ID as a local provider identifier.</p> <p>Otherwise, if there is no HPI-I and no exemption from the requirement to provide one, the message will be rejected.</p>

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref./Notes
33	00265	Assistant Result Interpreter	O	Y	CM	Not used
34	00266	Technician	O	Y	CM	Not used
35	00267	Transcriptionist	O	Y	CM	Not used
36	00268	Scheduled Date/Time	O		TS	Not used
37	01028	Number of Sample Containers	O		NM	Not used
38	01029	Transport Logistics of Collected Sample	O	Y	CE	Not used
39	01030	Collector's Comment	O	Y	CE	Not used
40	01031	Transport Arrangement Responsibility	O		CE	Not used
41	01032	Transport Arranged	O		ID	Not used
42	01033	Escort Required	O		ID	Not used
43	01034	Planned Patient Transport Comment	O	Y	CE	Not used

4.3.5 OBX – Observational Results

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref.
1	00569	Set ID - OBX	O		SI	Not used
2	00570	Value Type	R*		ID	"ED" or "RP" Value Type determines if the diagnostic imaging report PDF is embedded as Base64 string (ED) or to be read from a pre-configured location (RP). The pre-configured location is set in the web.config of the HIPS application server.

Seq#	Item#	Name	R/O	RP/#	DT	Format/Ref.
3	00571	Observation Identifier	R		CE	Expected value: "PDF^Display format in PDF^AUSPDI" Identifier ^ Text ^ Name of Coding System ^ Alternate Identifier ^ Alternate Text ^ Name of Alternate Coding System HIPS will ignore all OBX segments except one with Identifier "PDF".
4	00572	Observation Sub-ID	C		ST	
5	00573	Observation Value	R*		ED or RP	Based on the value in OBX-2 Value Type, HIPS obtains the Base-64 string in OBX-5.5 or the file name in OBX-5.1 for the report PDF.
6	00574	Units	O		CE	
7	00575	References Range	O		ST	
8	00576	Abnormal Flags	O	Y/5	ID	
9	00577	Probability	O		NM	
10	00578	Nature of Abnormal Test	O	Y	ID	
11	00579	Observ Result Status	R		ID	
12	00580	Date Last Obs Normal Values	O		TS	
13	00581	User Defined Access Checks	O		ST	
14	00582	Date/Time of the Observation	O		TS	
15	00583	Producer's ID	O		CE	
16	00584	Responsible Observer	O		XCN	
17	00936	Observation Method	O	Y	CE	

5 Data Type Definitions

This section details the specific implementation details for certain data types in use. Whenever the data type is referenced, the format here is followed. This section provides a more comprehensive view of the data types.

5.1 XTN Data Type

The XTN data type utilises the extended format as described in the following table. The following table describes the values in use when populated.

Field	Component Name	Data Sub Type	Format
1	Number	ST*	If supplied, should be same as component 7.
2	Use Code	ID	HL7 table 0201
3	Equipment Type	ID	HL7 table 0202
4	Email address	ST	
5	Country Code	ST*	International dialling country code.
6	Area Code	ST*	Area (STD) code.
7	Phone Number	ST*	Contains local portion of phone number, or full mobile (04xxxxxxx).
8	Extension	ST*	
9	Additional text	ST	

* Variance to HL7 v2.4 which uses NM for these component types.

Examples:

- mobile number: 0414124124^PRN^CP^^^^0414124124
- home phone: 83321234^PRN^PH^^^08^83321234

5.2 TS Data Type

The TS data type contains two components, as described in the following table. The precision component is optional.

Field	Component Name	Data Sub Type	Format
1	Time	ST	YYYY[MM[DD[hhmm[SS[.S[S[S[S]]]]]]][+/-ZZZZ]
2	Precision	ST	“YYYY[MM[DD[hhmm[SS[.S[S[S[S]]]]]]][+/-ZZZZ]” down to the level of precision. E.g.: “YYYYMM” would indicate a precision down to the month.

5.3 XCN Data Type

The XCN data type is used in OBR-16 Ordering Provider as defined in the following table.

Sequence	Component Name	Data Sub Type	Format
1	ID Number	ST	HPI-I value or local identifier Not presently mapped into CDA document.
2	Family Name	FN	Family name
3	First Given Name	ST	Given name(s)
4	Middle Names	ST	Not used
5	Suffix	ST	Not used
6	Prefix	ST	Title
7	Degree	IS	Not used
8	Source Table	IS	Not used
9	Assigning Authority	HD	“AUSHIC” for HPI-I Other values indicate local identifiers.
10	Name Type Code	ID	Not used
11	Identifier Check Digit	ST	Not used
12	Check Digit Scheme	ID	Not used
13	Identifier Type Code	IS	Not used
14	Assigning Facility	HD	<i>See below</i>
15	Name Representation Code	ID	Not used
16	Name Context	CE	Not used
17	Name Validity Range	DR	Not used
18	Name Assembly Order	ID	Not used

The following table defines the values for the subcomponents of Assigning Facility.

Sequence	Subcomponent Name	Description
1	Namespace ID	Organisation name.

Sequence	Subcomponent Name	Description
2	Universal ID	"1.2.36.1.2001.1003.0.HPI-O" where HPI-O is the HPI-O of the organisation.
3	Universal ID Type	"ISO" to indicate the Universal ID is an OID.

5.4 CE Data Type

The CE data type is as per the HL7 2.4 specification. For elements that have been standardised the 'alternate' portion of the CE will generally contain the original source information. Non-standardised values from source systems are expected to be passed in CE fields, particularly in repeating fields and therefore validating the coding system is essential to utilising the standardised values.

The 'alternative' portion of the CE datatype where supplied is for internal reference only and as a general rule should be ignored by receiving systems. Where the alternative value is present it will contain the value prior to transformation to the standard code system. This is of use to internal support personnel to debug missing or incorrect transformations. HIPS will generally ignore the alternate portion of the CE.

The usage of the 'alternative' portion of OBR-4 Test Result Name is contrary to the above guideline as it is mapped to the primary Examination Result Name, whereas the 'standard' portion is mapped to a Translation of the Examination Result Name.

Acronyms

Acronym	Description
ADT	admission, discharge, transfer
CDA	Clinical Document Architecture
DVA	Department of Veterans' Affairs
ESB	enterprise service bus
HPI-I	Healthcare Provider Identifier - Individual
IHI	individual healthcare identifier
IHTSDO	International Health Terminology Standards Development Organisation
IRN	individual reference number
MRN	medical record number
OBR	observation request segment of the HL7 message
OBX	observation result segment of the HL7 message
OID	object identifier
ORC	common order segment of the HL7 message
ORU	unsolicited transmission of an observation
RIS	Radiology information systems
SMI	sample medical imaging
SNOMED	Systematized Nomenclature of Medicine
SOAP	Simple Object Access Protocol
UUID	universally unique identifier
WSDL	Web Services Description Language
XSD	XML schema Definition

Glossary

Term	Meaning
admission, discharge, transfer	Class of HL7 message types. Refer to the <i>Patient Administration HL7 v2 Profile</i> document for further information on the ADT message interface of HIPS.
enterprise service bus	Integration hub for routing and transforming messages within and between healthcare facilities.
medical record number	<p>A local identifier of a consumer, identified by the codes “PI” or “MR” in PID-3. Ideally one MRN is allocated by a healthcare facility for each patient, though it is common to temporarily allocate a new MRN for new patients until their identity is confirmed. These temporary MRNs should be merged back to the original MRN for the patient using an ADT A36 Merge MRN message. Refer to the <i>Patient Record Merging Profile</i> and <i>Patient Administration HL7 v2 Profile</i> documents for further information.</p> <p>HIPS stores the primary local identifier of each consumer in HospitalPatient.Mrn and uses the primary identifier to find existing patient records in the HIPS database.</p>
observation request segment	Segment of the HL7 message used to transmit information specific to an order for a diagnostic study or observation, physical exam, or assessment.
observation result segment	<p>Segment of the HL7 message used to transmit a single observation or observation fragment.</p> <p>The PDF body of the diagnostic imaging report may be embedded or referenced in an OBX segment, or embedded or referenced in a separate parameter of the SOAP request. HIPS ignores other OBX segments.</p>
object identifier	A globally unambiguous persistent identifier for an object, constructed as a hierarchy of nodes in a tree. Each node is controlled by an assigning authority, which may define child nodes under the node and delegate assigning authority for the child nodes. An OID is represented by a series of integers separated by dots.
common order segment	Optional segment of the HL7 message, which is accepted but not used by HIPS.
unsolicited transmission of an observation	An HL7 message type. The interface described in this document accepts ORU R01 events.
